

Application No. 10/665,497
Art Unit 365

Docket No.: 1259-0237P

After Final Office Action of April 10, 2006

REMARKS

A Petition for Extension of Time has been concurrently filed with this response. Thus, this response is being timely filed (September 10, 2006 falls on a Sunday).

Applicants submit that the amendments herein are fully supported by the canceled dependent claims as well as by the present specification and add no new matter. Further, the amendments herein address issues that are first raised in the outstanding Office Action (the new written description rejection), and were not made earlier because the first indication to Applicants that the present amendments would be needed was in that Office Action. Therefore, entry of the present amendment is proper, and is respectfully requested.

Accordingly, it is respectfully requested that the present Reply be entered into the Official File in view of the fact that the Reply automatically places the application in condition for allowance. In the alternative, if the Examiner continues with the rejections of the present application, it is respectfully requested that the present Reply be entered for purposes of an Appeal. The Reply reduces the issues on appeal by reducing the number of claims, if not overcome at least one of the outstanding rejections.

Applicant respectfully requests the Examiner to reconsider the present application in view of the foregoing amendments to the claims.

Status of the Claims

In the present Reply, claim 1 has been amended. Also, claims 2, 3, 6, 10, 13 and 14 are canceled without prejudice or disclaimer of the subject matter contained therein. Claims 17-21

were previously canceled without prejudice or disclaimer of the subject matter contained therein. Thus, claims 1, 4, 5, 7, 8, 9, 11, 12, 15 and 16 are pending in the present application.

No new matter has been added by way of the amendment to claim 1 in the subject matter of canceled claims 2, 3, 6, 10, 13 and 14 are now incorporated into claim 1. Further, the present specification in the form of Figures 1-2 supports the instant amendment.

Based upon the above considerations, entry of the present amendment is respectfully requested.

In view of the following remarks, Applicant respectfully requests that the Examiner withdraw all rejections and allow the currently pending claims.

Issues under 35 U.S.C. § 112, First Paragraph

Claims 1-16 stand rejected under 35 U.S.C. § 112, first paragraph, for asserted lack of written description. Applicant respectfully traverses, and reconsideration and withdrawal of this rejection are respectfully requested.

The issue in the Office Action is that the present specification does not literally disclose "Shore A" hardness (the JIS K6253 standard) as recited in pending claim 1. The JIS K6253 standard is also mentioned in Applicants' specification at page 6, line 28. Applicants herein attach an English language translation of the Japanese Industrial Standard (JIS) K6253 from the Japanese Standards Association. It is believed that the Examiner's concern is addressed in this attachment (see, e.g., section 3.2). Accordingly, reconsideration and withdrawal of this rejection are respectfully requested.

Issues under 35 U.S.C. § 103(a)

Claims 1-11 and 13-16 stand rejected under 35 U.S.C. § 103(a) as being unpatentable over Lucas '806 (U.S. Patent No. 5,553,806) in view of Harkins '462 (U.S. Patent No. 2,353,462) (see pages 3-4 of the Office Action).

Also, claim 12 stands rejected under 35 U.S.C. § 103(a) as being unpatentable over Lucas '806 in view of Harkins '462 as applied to claims 1, 10 and 11 above, and further in view of Perrigo '373 (U.S. Patent 5,035,373) (see page 4 of the Office Action).

Applicant respectfully traverses, and reconsideration and withdrawal of these rejections are respectfully requested.

Applicants note that the cited primary reference of Lucas '806 has a groove pattern on its peripheral surface thereof (see its Figures 1 and 11). Figure 11 of Lucas '806 is the cross-sectional view through section "C" of Figure 10 that shows the profile of some of the recessed holes in the cover (see column 3, lines 63-65). In contrast, the present invention has a flat peripheral surface over the entire length of the rotatable lay-on roll. Such a feature of the present invention also produces an advantageous effect such that electrostatic charge is suppressed across the full width of the polymer film when used. When in use, the instantly claimed film winding method provides the manufacture of a polymer film of high quality with improved, high reliability in production (as described in the present specification at, e.g., page 3, lines 11-17). On the other hand, the cited combinations of references fail to disclose the instantly claimed rotatable lay-on roll having the flat peripheral surface, as well as lacking any disclosure of the advantage of suppression of electrostatic charge to such an embodiment.

Therefore, for the reasons stated above, a *prima facie* case of obviousness has not been established for either rejection since not all requirements thereof have been satisfied. In particular, a *prima facie* case of obviousness requires disclosure of all claimed features, *In re Vaeck*, 947 F.2d 488, 493, 20 U.S.P.Q.2d 1438, 1442 (Fed. Cir. 1991), wherein each of the cited combinations of references fails to meet this requirement.

Also, the Examiner refers Applicants to page 3, column 1, lines 15-21 of the secondary reference of Harkins '462, and then concludes how Harkins '462 teaches such prevention of static build-up (see page 3 of the Office Action). However, Harkins '462 also discloses at the same place a Shore A hardness of 85. This hardness is inconsistent with the primary reference (see the Office Action at page 3, lines 7-8), as well as being inconsistent with the present invention. The Examiner also cites Harkins '462 for its disclosure of a rubber cover having the electrical resistivity of 20,000 ohms cm. However, such disclosure in Harkins '462 relates to a certain Shore A hardness. Thus, Harkins '462 is improperly combined with the other cited references, and the cited combinations of references still do not disclose all instantly claimed features. *In re Vaeck; supra*.

Further, the requisite motivation is lacking since it is not *prima facie* obvious to modify a reference unless the references suggest an advantage to be gained from the modification. *See In re Sernaker*, 217 USPQ 1, 6 (Fed. Cir. 1983). Here, and as mentioned, each of the cited combinations of references fails to disclose the unexpected advantage of suppressing electrostatic charge with the instantly claimed film winding method. Further, not even the primary reference of Lucas '806 describes such an advantage as achieved by the present invention. Thus, the requisite motivation is lacking as well. *Vaeck; Sernaker; supra*.

Applicants also note that while patents are relevant as prior art for all they contain, they cannot be relied upon to teach embodiments that are not reasonably suggested to one having ordinary skill in the art. *Merck & Co. v. Biocraft Laboratories*, 874 F.2d 804 (Fed. Cir. 1989). In the instant case, the skilled artisan could not reasonably infer from Harkins '462 a different Shore A hardness other than the 85 value as disclosed at page 3, column 1, line 21 or 22. Thus, the instant rejections are improper and the requisite motivation is lacking. *In re Vaeck; Merck; supra*.

Accordingly, reconsideration and withdrawal of both rejections are respectfully requested.

Conclusion

A full and complete response has been made to all issues as cited in the Office Action. Applicants have taken substantial steps in efforts to advance prosecution of the present application. Thus, Applicants respectfully request that a timely Notice of Allowance issue for the present case.

Should there be any outstanding matters that need to be resolved in the present application, the Examiner is respectfully requested to contact Eugene T. Perez (Reg. No. 48,501) at the telephone number of the undersigned below.

Application No. 10/665,497
Art Unit 3654
After Final Office Action of April 10, 2006

Docket No.: 1259-0237P

If necessary, the Commissioner is hereby authorized in this, concurrent, and future replies, to charge payment or credit any overpayment to Deposit Account No. 02-2448 for any additional fees required under 37 C.F.R. §§ 1.16 or 1.17; particularly, extension of time fees.

Dated: Monday, September 11, 2006

Respectfully submitted,

By

Hardness testing methods for rubber, vulcanized or thermoplastic

Introduction This Japanese Industrial Standard has been prepared on the basis of the 3rd edition of ISO 48, *Rubber, vulcanized or thermoplastic—Determination of hardness (hardness between 10 IRHD and 100 IRHD)* published in 1994, and the 1st edition of ISO 7619, *Rubber—Determination of indentation hardness by means of pocket hardness meters* published in 1986, without any modification in technical contents. However, "Type E of spring type (durometer hardness)" which is not specified in the corresponding International Standards are added in this Standard.

1 Scope This Japanese Industrial Standard specifies the testing methods to measure hardness of vulcanized rubber and thermoplastic rubber (hereafter referred to as "vulcanized rubber").

Remarks 1 The standards cited in this Standard are listed as follows.

JIS K 6200 *Glossary of terms used in rubber industry*

JIS K 6250 *General rules of physical testing methods for rubber, vulcanized or thermoplastic*

JIS Z 8401 *Rules for rounding off of numerical values*

2 The International Standards corresponding to this Standard are listed as follows.

ISO 48 : 1994 *Rubber, vulcanized or thermoplastic—Determination of hardness (hardness between 10 IRHD and 100 IRHD)*

ISO 7619 : 1986 *Rubber—Determination of indentation hardness by means of pocket hardness meters*

3 The units and numerical values given in { } in this Standard are based on traditional units, and are appended for informative reference.

2 Definitions For the purposes of this Standard, the definitions given in JIS K 6200 and JIS K 6250, and the following definitions apply.

(1) **international rubber hardness degree** Hardness which can be obtained through conversion into international rubber hardness degree (IRHD)⁽¹⁾ using the depth of indentation by a plunger when the plunger, with a ball-type lower end, is vertically impressed on the surface of a test piece with specified indenting force.

A hardness scale is chosen so that "0" represents the hardness of material having a Young's modulus of zero and "100" represents the hardness of a material of infinite Young's modulus, and the following conditions are fulfilled over most of normal range of hardness.

(a) One international rubber hardness degree always represents approximately the same proportionate difference in the Young's modulus.

(b) For highly elastic rubber, the scales of international rubber hardness degree and that of type A durometer are comparable.

Note (1) IRHD International Rubber Hardness Degree

- (2) **durometer hardness** The hardness given by the testing apparatus (durometer) which reads the indentation depth made by a specifically shaped indenter when it is impressed on the surface of a test piece via a spring.
- (3) **IRHD pocket hardness** The hardness given by a portable pocket testing apparatus (IRHD pocket hardness meter) by which international rubber hardness degree can be conveniently obtained owing to reading the indented depth made by an indenter, with a ball-type lower end, when it impressed on the surface of a test piece via a spring.
- (4) **standard hardness** The hardness obtained using the specified procedures on test pieces whose shape and dimensions satisfy the specifications, when carrying out each test.
- (5) **apparent hardness** The hardness obtained either using other procedures than the specified, or on the test piece whose shape and dimensions do not satisfy the specification, when carrying out each test.

3 Type of test

3.1 Outline of hardness test There are many types of testing methods for hardness test depending on the principle of hardness measurement, range of hardness measurement, kind of testing apparatus and so on, and they are classified into standard hardness and apparent hardness by shape or dimensions of a test piece. The outline of classifying is shown in Table 1.

Table 1 Outline of hardness tests

Principle of measurement	Range of hardness measurement	Type of testing apparatus	Testing method	Test condition for standard hardness		
				Shape	Thickness mm	Minimum distance from the edge of sample mm
Constant-force type (international rubber hardness degree)	For high hardness (85 to 100 IRHD)	Normal size international rubber hardness meter	H method	Both upper and lower surfaces are smooth and parallel each other.	8.0 min.	9.0
			N method		10.0 max.	10.0
	Microsize international rubber hardness meter	M method			8.0 min.	9.0
					10.0 max.	10.0
					1.5 min.	2.0
					2.5 max.	
	For low hardness (10 to 35 IRHD)	Normal size international rubber hardness meter			L method	10.0 min.
			15.0 max.			11.5
Spring type (durometer hardness)	For high hardness (A90 or more)	Type D durometer		6.0 or more	12.0	
	For normal hardness (A10 to 90)	Type A durometer		6.0 or more	12.0	
	For low hardness (A20 or less)	Type E durometer		10.0 or more	12.0	
Spring type (IRHD pocket hardness)	For normal hardness (30 to 95 IRHD)	IRHD pocket hardness meter	P method	6.0 or more	12.0	

3.2 Type of tests The type of hardness tests for vulcanized rubber shall be classified as follows.

(1) International rubber hardness test

- (a) H method (normal size test for high hardness)
- (b) N method (normal size test for normal hardness)
- (c) M method (microsize test for normal hardness)
- (d) L method (normal size test for low hardness)

(2) Durometer hardness test

- (a) Type D (test for high hardness)
- (b) Type A (test for normal hardness)
- (c) Type E (test for low hardness)

(3) IRHD pocket hardness test

- (a) P method (for normal hardness)

4 International rubber hardness test

4.1 Purpose This test shall be carried out to measure the international rubber hardness degree of vulcanized rubber.

4.2 Range of measurement The measuring range of this test is decided according to the thickness and hardness of a test piece for every testing method. The measuring range of each testing method is as follows.

- (1) **H method** Formal measuring range shall be for the test piece measuring 8.0 mm to 10.0 mm in thickness and with hardness of 85 IRHD to 100 IRHD. It is permissible to test the one with 4.0 mm or more thickness and with hardness of 85 IRHD to 100 IRHD.
- (2) **N method** Formal measuring range shall be for the test piece measuring 8.0 mm to 10.0 mm in thickness and with hardness of 35 IRHD to 85 IRHD. It is permissible to test the one with 4.0 mm or more thickness and with hardness of 30 IRHD to 95 IRHD⁽²⁾.
- (3) **M method** Formal measuring range shall be for the test piece measuring 1.5 mm to 2.5 mm in thickness and with hardness of 35 IRHD to 85 IRHD. It is permissible to test the one with 1.0 mm to 4.0 mm thickness and with hardness of 30 IRHD to 95 IRHD⁽²⁾.
- (4) **L method** Formal measuring range shall be for the test piece measuring 10.0 mm to 15.0 mm in thickness and with hardness of 10 IRHD to 35 IRHD. It is permissible to test the one with 6.0 mm or more thickness and with hardness of 10 IRHD to 35 IRHD.

Notes (2) The hardness values in 85 IRHD to 95 IRHD and 30 IRHD to 35 IRHD obtained by N method do not exactly coincide with the values by H method and L method, but the discrepancy does not come into technical problem, generally speaking.

4.3.3 Plunger The plunger shall be vertical, and its lower end has spherical shape whose diameter shall be as shown in Table 2⁽⁶⁾. The lower end ball of a plunger shall be kept a little upper than the face of pressure foot before contact force is applied.

Note ⁽⁶⁾ The material of end ball shall be abrasion resistant and corrosion resistant.

When an end ball is connected with the body of plunger, the connected part must not be larger than diameter of the ball.

4.3.4 Loading device Loading device shall accurately apply the contact force⁽⁷⁾ and indenting force⁽⁸⁾ specified in Table 2 to the end ball of a plunger.

Notes ⁽⁷⁾ Contact force means the force causing the end ball of a plunger to contact with surface of a test piece.

⁽⁸⁾ Indenting force means the force to impress the end ball of a plunger into test piece after making contact.

4.3.5 Measuring device of indented depth The measuring device for indented depth shall be capable of measuring indented depth of a plunger when indenting force is applied to a plunger, by which the indented depth or IRHD shall be directly read⁽⁹⁾. The conversion from indented depth to IRHD can be done through Table 3, Table 4 and Table 5⁽¹⁰⁾.

Notes ⁽⁹⁾ For the measuring device of indented depth, any of mechanical, optical, or electrical, is serviceable.

⁽¹⁰⁾ Table 3 is for the conversion of H method, and Table 4 for N method. In case of M method, convert after making the indented depth shown in Table 4 one-sixth. Table 5 is the conversion table for L method.

4.3.6 Vibrating device To overcome minute friction, it is preferable to install a vibrating device like an electric buzzer by which a testing apparatus is suitably vibrated. It can be eliminated if friction is completely removed.

4.3.7 Thermostat The thermostat is needed when the test temperature other than standard condition of laboratory is employed for measuring hardness. The thermostat must keep the specified temperature in the tolerance of $\pm 2^{\circ}\text{C}$. The annular foot with pressure face at lower end and a plunger shall penetrate through the upper part of the thermostat.

The part through which the plunger penetrates shall be made of the material with small thermal conductivity. The sensor for temperature measurement shall be installed at holding place of test piece or its vicinity, in the thermostat.

Table 3 Conversion table from indented depth (*D*) of a plunger to international rubber hardness degree (IRHD) (H method)

4.4 Test piece

4.4.1 Shape of test pieces Both surfaces of a test piece shall be smoothly flat and parallel each other⁽¹¹⁾. This test has been supposed to compare the test pieces having the same thickness.

Note ⁽¹¹⁾ The surface such as unsmoothed, curved, or rough, does not give satisfactory results. For specially formed surface, however, such as rubber roll, this method can be applied.

The international rubber hardness testing method for curved test piece is shown in Informative reference.

4.4.2 Thickness

- (1) **H method and N method** The standard thickness of a test piece is 8.0 mm to 10.0 mm, but to get necessary thickness, it is permissible to pile smooth and parallel test pieces. Provided that the thickness of test pieces before piling shall be 2 mm or more, and 3 or more test pieces cannot be piled up. Even when nonstandard test piece other than above⁽¹²⁾ is to be adopted, the thickness of the test piece must be 4.0 mm or more.
- (2) **L method** The standard thickness of a test piece is 10.0 mm to 15.0 mm, but to get necessary thickness, it is permissible to pile smooth and parallel test pieces. Provided that the thickness of test pieces before piling shall be 2 mm or more, and 3 or more test pieces cannot be piled up. Even when nonstandard test piece other than above⁽¹²⁾ is to be adopted, the thickness of the test piece must be 6.0 mm or more.
- (3) **M method** The standard thickness of a test piece is (2.0 ± 0.5) mm. Even when nonstandard test piece other than above⁽¹²⁾ is to be adopted, the thickness of the test piece must be 1.0 mm or more.

Note ⁽¹²⁾ The measured value resulted from nonstandard test piece, is not generally coincident with the measured value by standard test piece.

4.4.3 Lateral dimensions

- (1) **H method, N method, and L method** The lateral dimension of a test piece shall be large enough to measure at the point which is apart from edge of the test piece by at least the distance shown in Table 6.

Table 6 Minimum distance of point for hardness measurement (point of end ball of plunger) from test-piece edge

Unit: mm	
Thickness of a test piece	Minimum distance of point for hardness measurement from test-piece edge
4.0	7.0
6.0	8.0
8.0	9.0
10.0	10.0
15.0	11.5
25.0	13.0

- (2) **M method** The lateral dimension of a test piece shall be large enough to measure at the point which is apart from edge of the test piece by at least 2.0 mm. When the test piece, with the thickness of 4.0 mm or more, which is not eligible for N method because of small lateral dimension or of not having large smooth area, is to be tested by M method, carry out test at the point apart from edge of the test piece as far as possible.

4.4.4 Sampling and preparation of test pieces The sampling and preparation of test pieces shall principally follow 6.5 of JIS K 6250.

4.4.5 Selection of test pieces The test pieces which contain alien matters, bubbles, or flaws shall not be used for tests.

4.5 Testing method

4.5.1 Testing conditions Testing conditions shall be as follows.

- (1) The standard conditions of a laboratory shall follow 6.1 of JIS K 6250.
- (2) Storing of sample and test pieces shall follow 6.2 of JIS K 6250.
- (3) The standard conditions of test pieces shall follow 6.3 of JIS K 6250.

4.5.2 Procedures Sprinkle slightly talc on upper and back surfaces of a test piece to lessen friction between the end ball of a plunger and surface of a test piece. Place the test piece on the holding base of a test piece. Make the face of pressure foot touch with the surface of the test piece.

- (1) When the scale is graduated with IRHD, apply contact force to the plunger for 5 s, and adjust the scale to be 100. Then, apply indenting force for 30 s, and read directly hardness by IRHD.
- (2) When the scale is graduated with indented depth, apply contact force to the plunger for 5 s, and read the scale. Then, apply indenting force for 30 s, and read the scale. Calculate the difference between indentation by contact force and that by indenting force, and make this the indented depth D . Convert the value of D into IRHD making use of Table 3, Table 4, and Table 5.

While applying force, the slight vibration may be applied on the testing apparatus by a vibrating device to overcome the friction. Carry out measurements at 3 or 5 new points on a test piece at every measurement.

4.6 Arrangement of test results Round off the median of 3 or 5 measurements to whole number according to JIS Z 8401, and mark the sign IRHD after it. In case of standard hardness, after it mark "/" together with letter "S", and then mark "/" with sign as H, N, M, or L, which means testing method. In case of apparent hardness, after sign of IRHD mark "/" together with sign as H, N, M, or L, which means testing method.

Example 1 50 IRHD/S/N: means that standard test piece is measured by N method of international rubber hardness test, and standard hardness is 50 IRHD.

Example 2 50 IRHD/M: means that nonstandard test piece is measured by M method of international rubber hardness test, and apparent hardness is 50 IRHD.

4.7 Record On test result, the following items shall be recorded.

- (1) Test result
- (2) Shape and dimensions of test piece (whether standard test piece or nonstandard one; in case of nonstandard, whether curved surface or not; and in case of piled one, the number of piled pieces and its thickness)
- (3) Sampling and preparation methods of test pieces
- (4) Test temperature
- (5) Other items specially needed

5 Durometer hardness test

5.1 Purpose This test shall be carried out to measure durometer hardness of vulcanized rubber.

5.2 Range of measurement The measuring range of this test is decided according to the hardness of test piece at every testing method. The measuring range of each testing method is as follows.

- (1) **Type D durometer** The measuring range of type D durometer hardness is the range over A90 by type A durometer. When less than D20, measure by type A durometer.
- (2) **Type A durometer** The measuring range of type A durometer hardness is from A10 to A90, and when over A90, measure by type D durometer. When less than A20, measure by type E durometer.
- (3) **Type E durometer** The measuring range of type E durometer hardness is the range of less than A20 by type A durometer.

5.3 Testing apparatus

5.3.1 Outline of testing apparatus The testing apparatus is composed of the face of pressure foot by which the surface of a test piece is pressed, indenter which protrudes from a central hole of face of pressure foot by action of a spring, and the graduation which indicates the distance (indenting depth) of indenter rejected by rubber cushion and which represents hardness itself.

5.3.2 Face of pressure foot The face of pressure foot is perpendicular to the indenter, and its center has a hole for the indenter. The diameter of the hole, in case of type D and type A durometer, is $3.0^{+0.2}_{-0.5}$ mm, and in case of type E durometer, (5.4 ± 0.2) mm.

On the face of pressure foot, the distance from any place of its outer edge to the center of an indenter shall be, in case of type D and type A durometer, 6 mm or more, and in case of type E durometer, 7 mm or more.

5.3.3 Indentor The material of indentor shall be abrasion resistant and corrosion resistant, and it shall be accurately fixed at center of the hole of face of pressure foot. Its shape and dimensions are indicated in Fig. 1 for type D durometer, in Fig. 2 for type A durometer, and in Fig. 3 for type E durometer.

Fig. 1 Indentor for type D durometer

Fig. 2 Indentor for type A durometer

Fig. 3 Indentor for type E durometer

5.3.4 Scale When the scale indicates 0 (full protrusion), the point of the indenter shall protrude by (2.50 ± 0.04) mm beyond the face of the pressure foot.

When the scale indicates 100 (nil protrusion), the face of the pressure foot is in firm contact with a flat piece of glass, i.e. the point of the indenter shall be positioned on the same plane with the face of the pressure foot. The scale shall be graduated with equal intervals in the range between 0 to 100.

5.3.5 Spring There must be the following relation between the force of spring and the scale, that is, the durometer hardness.

(1) Type D durometer

$$W_D = 444.5H_D \{w_D = 45.33H_D\}$$

where, W_D : force of spring of type D durometer (mN)

w_D : force of spring of type D durometer (gf)

H_D : hardness of type D durometer

(2) Type A and type E durometer

$$W_A = 550 + 75H_A \{w_A = 56.1 + 7.65H_A\}$$

where, W_A : force of spring of type A or type E durometer (mN)

w_A : force of spring of type A or type E durometer (gf)

H_A : hardness of type A or type E durometer

The tolerance of force shall be, in case of type D durometer, ± 440 mN (± 44.9 gf), and in case of type A and type E durometer, ± 80 mN (± 8.16 gf).

5.3.6 Calibration of spring Hold vertically the end point of indenter of a durometer on a balance not to give any interference between the balance and face of pressure foot, via a spacer (see Fig. 4). The cylindrical spacer with 2.5 mm height, in case of type D and type A durometer, measuring 1.25 mm in diameter, and in case of type E durometer, measuring 3 mm in diameter, has a wineglass shape where an indenter is to touch, in order to smoothly receive the end point of the indenter. Place a tare on the balance against the weight of the spacer. Place counterweight to get suitable scale, and confirm that the force (mN) shown here stays within the tolerance of specified force in 5.3.5. Carry out the above calibration using suitable scale interval.

The calibration of spring of a durometer may be done with an electrobalance other than chemical balance shown in Fig. 4. In this case, the measuring sensitivity of the force at end point of an indenter shall be, in case of type D durometer, 44 mN (4.5 gf) or less, and in case of type A and type E durometer, 8 mN (0.82 gf) or less.

The following method is permissible; place upside down the durometer, and directly apply the load on its indenter by counterweight. Provided that the correction about the mass of parts inside of the durometer shall be considered to prevent the discrepancy between this method and the method by Fig. 4. In this case, the accuracy on the mass of counterweight shall be ± 4.5 g or less in case of type D durometer and ± 0.82 g or less in case of type A and type E durometer.

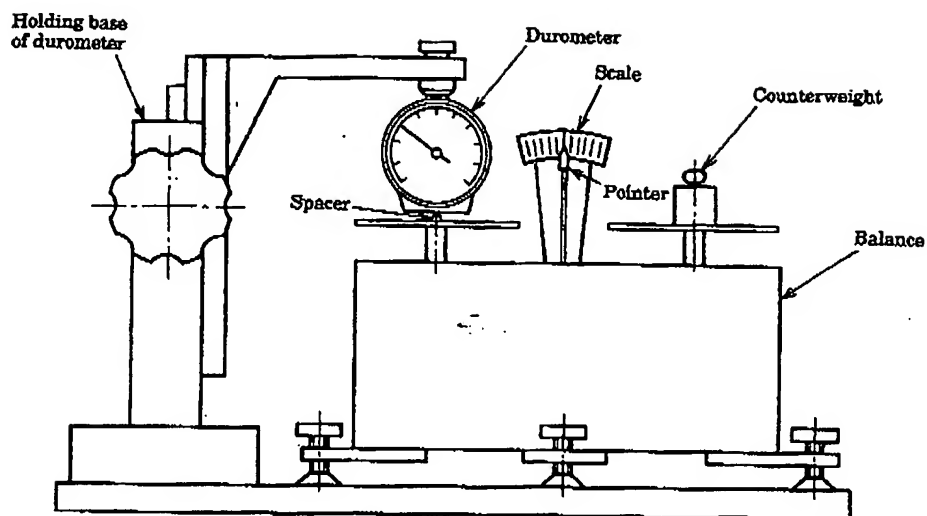

Fig. 4 Example of calibration apparatus of spring

5.4 Test piece

5.4.1 Shape and dimensions of test pieces The thickness of a test piece for type D and type A durometer is 6 mm or more. When it is less than 6 mm, pile them to make 6 mm or more for measurement. The thickness of a test piece for type E durometer is 10 mm or more, and in case of less than 10 mm, pile them to make 10 mm or more. The number of test pieces to pile shall be at most 3, and each of them shall have 2 mm or more thickness. The test result brought by piled up test piece doesn't generally coincide with the result by solid test piece⁽¹³⁾. The lateral size of test piece shall be large enough to measure at the point where the end point of an indenter is apart 12 mm or more from the edge of the test piece.

Furthermore, the test piece shall have smooth surface spacious enough to make close contact with face of pressure foot of a durometer⁽¹⁴⁾.

Notes (13) To make comparison, it is necessary to use the test piece which has the same number for piling and the same thickness.

(14) The surface such as unsmoothed, curved, or rough, does not give satisfactory results. For specially formed surface, however, such as rubber roll, this method can be applied. In this case, the applicable limit of the durometer shall be definitely confirmed.

5.4.2 Sampling and preparation of test pieces The sampling and preparation of test pieces shall follow 6.5 of JIS K 6250.

5.4.3 Selection of test pieces The test pieces which contain alien matters, bubbles, or flaws shall not be used for test.

5.5 Testing method

5.5.1 Testing conditions Testing conditions shall be as follows.

(1) The standard conditions of a laboratory shall follow 6.1 of JIS K 6250.

- (2) Storing of sample and test pieces shall follow 6.2 of JIS K 6250.
- (3) The standard conditions of test pieces shall follow 6.3 of JIS K 6250.

5.5.2 Procedures Place a test piece on a rigid, hard, and flat surface. Set a durometer so as to make an indenter rectangular to the target surface of a test piece. Contact closely as swiftly as possible the face of pressure foot with the target surface of the test piece without giving a impact, and read the scale within 1 s, to find the hardness of the test piece⁽¹⁵⁾. But the agreement between the parties concerned with delivery may permit to read when a definite time passed after close contacting between them. The end point of the indenter of a durometer must be apart 12 mm or more from the edge of the test piece. Unless otherwise specified, the duration from close contacting to the finish of reading shall be recorded. The measuring points shall be 5, which are apart at least 6 mm each other, and carry out measurements 5 times on these points. When hardness shown by type A durometer is over A90, employ a type D durometer. When the hardness shown by type D durometer is less than D20, employ a type A durometer. If the hardness by type A durometer is less than A10, result is inaccurate, so don't record it.

When the hardness by a type A durometer is less A20, measure it with a type E durometer.

Note ⁽¹⁵⁾ In order to get a good repeatability, the holding base for durometer may be used by which the durometer is vertically kept and target surface and indenter get right angle each other before measurement. In this case, it is recommended that the mass imposed on the pressing surface is 5.0 kg for type D durometer, and 1.0 kg for both type A and type E durometer.

5.6 Arrangement of test results Round off the median of 5 measurements to whole number according to JIS Z 8401, and mark sign D in case of type D durometer, sign A in case of type A durometer, and sign E in case of type E durometer, just before the rounded value. When the value was read when definite time passed after close contacting, mark sign "/" and then record the duration (s). When it is standard hardness, the above is followed by "/" and then by sign S.

Example 1 D85/15/S: means that standard test piece is measured by type D durometer hardness test, and the reading on standard hardness is 85 when 15 s passed after close contacting of face of pressure foot.

Example 2 A45/S: means that standard test piece is measured by type A durometer hardness test, and the reading on standard hardness is 45 within 1 s after close contacting of face of pressure foot.

Example 3 A45/15: means that nonstandard test piece is measured by type A durometer hardness test, and the reading on apparent hardness is 45 when 15 s passed after close contacting of face of pressure foot.

Example 4 E60: means that nonstandard test piece is measured by type E durometer hardness test, and the reading on apparent hardness is 60 within 1 s after close contacting of face of pressure foot.

5.7 Record On test result, the following items shall be recorded.

- (1) Test result

- (2) Shape and dimensions of test piece (whether standard test piece or nonstandard test piece; in case of piled up test piece, the number of piled pieces, and its thickness)
- (3) Sampling and preparation methods of test pieces
- (4) Other items specially needed

6 IRHD pocket hardness test

6.1 Purpose This test shall be carried out to measure the international rubber hardness degree of vulcanized rubber by IRHD pocket hardness meter, and abbreviated P method.

6.2 Testing apparatus

6.2.1 Outline of testing apparatus The testing apparatus is composed of a face of pressure foot to press the surface of a test piece, indenter which protrudes from a central hole of face of pressure foot by action of a spring, and a mechanism indicating the protruded length of the indenter.

6.2.2 Face of pressure foot The face of pressure foot, measuring (20 ± 2.5) mm sided square, has a hole with 2.0 mm to 3.0 mm diameter at its center.

6.2.3 Indenter The end of the indenter shall make a hemisphere with 1.55 mm to 1.60 mm diameter.

6.2.4 Indicating mechanism The indicating mechanism shows the protruded length of an indenter from face of pressure foot, and it shall have been calibrated to read directly the international rubber hardness degree by IRHD. When the longest protruded length of 1.65 mm is given, it must show 28 IRHD, and when the face of pressure foot is let contact with a flat glass, that is, no protruded, it must show 100 IRHD.

6.2.5 Spring Spring can apply constant force of (2.65 ± 0.15) N $\{(270.3 \pm 15.3)$ gf to an indenter in the range from 28 IRHD to 100 IRHD.

6.2.6 Calibration of hardness meter IRHD pocket hardness meter shall be calibrated and adjusted using a standard rubber block whose international rubber hardness degree has been known. Only when the standard rubber block cannot be used, it is preferably calibrated with mechanical method.

Press the IRHD pocket hardness meter on a flat glass plate, and adjust the scale to get 100 IRHD. Making use of a set of standard rubber blocks from 30 IRHD to 90 IRHD, calibrate IRHD pocket hardness meter. The set of standard rubber blocks is stored in a container with a suitable cover after being sprinkled with talc powder, in order to prevent the influences by light, heat, oil, or grease. It consists of at least 6 test pieces. These standard blocks must be calibrated with the international rubber hardness test specified in 4 at intervals not exceeding six months. It is advisable that the IRHD pocket hardness meter, which is used daily, is calibrated at least once a week with standard rubber block.

Remarks : When IRHD pocket hardness meter is calibrated with mechanical method or adjusted, the instruction manual issued by the manufacturer shall be depended.

6.3 Test piece

6.3.1 Shape and dimensions of test pieces The thickness of a test piece shall be 6 mm or more. When it is less than 6 mm, the test piece which was prepared by piling up to 6 mm or more can be used, but the number of piling up shall be 3 or less, and each of them shall have 2 mm or more thickness. The test result comes from piled test piece does not usually coincide with the test result by solid test piece⁽¹³⁾. The lateral dimension of a test piece shall be large enough to measure at the point where the end point of an indenter is apart 12 mm or more from the edge of the test piece.

Test pieces shall have flat surface which is spacious to closely contact with the face of pressure foot of a hardness meter⁽¹⁶⁾.

Note ⁽¹⁶⁾ The surface such as unsmoothed, curved, or rough, does not give satisfactory results. For specially formed surface, however, such as rubber roll, this method can be applied. In this case, the applicable limit of the IRHD pocket hardness meter shall be definitely confirmed.

6.3.2 Sampling and preparation of test pieces The sampling and preparation of test pieces shall follow 6.5 of JIS K 6250.

6.3.3 Selection of test pieces The test pieces which contain alien matters, bubbles, or flaws shall not be used for test.

6.4 Testing method

6.4.1 Testing conditions Testing conditions shall be as follows.

- (1) The standard conditions of a laboratory shall follow 6.1 of JIS K 6250.
- (2) Storing of sample and test pieces shall follow 6.2 of JIS K 6250.
- (3) The standard conditions of test pieces shall follow 6.3 of JIS K 6250.

6.4.2 Procedures Place a test piece on a rigid, hard, and flat surface. Set an IRHD pocket hardness meter so as to make an indenter rectangular to the target surface of a test piece. Contact closely as swiftly as possible the face of pressure foot with the target surface of the test piece without giving a impact, and read the scale within 1 s, to find the hardness of the test piece. The end point of the indenter of an IRHD pocket hardness meter must be apart 12 mm or more from the edge of the test piece. Unless otherwise specified, read the value within 1 s after close contacting, but if the reading after special duration is specified, follow that specification. In this case, the duration from close contacting to the finish of reading shall be recorded. The measuring points shall be 5, which are apart at least 6 mm each other, and carry out measurements 5 times on these points.

6.5 Arrangement of test results Round off the median of 5 measurements to whole number according to JIS Z 8401, then mark sign IRHD after the value, and in case of standard hardness, after the value mark sign "H", then sign S, then again sign "P" and last sign P which means testing method. In case of apparent hardness, mark sign "A" after sign IRHD, then mark sign P which means testing method.

Example 1 50 IRHD/S/P: means that standard test piece is measured by IRHD pocket hardness meter, and the standard hardness is 50 IRHD.

Example 2 50 IRHD/P: means that nonstandard test piece is measured by IRHD pocket hardness meter, and the apparent hardness is 50 IRHD.

6.6 Record On test result, the following items shall be recorded.

- (1) Test result
- (2) Shape and dimensions of test piece (whether standard test piece or nonstandard test piece; in case of piled up test piece, the number of piled pieces, and its thickness)
- (3) Sampling and preparation methods of test pieces
- (4) Other items specially needed

Related standards :

ISO 7267/1 : 1986 *Rubber-covered rollers—Determination of apparent hardness—Part 1 : IRHD method*

ISO 7267/2 : 1986 *Rubber-covered rollers—Determination of apparent hardness—Part 2 : Shore-type durometer method*

Informative reference
International rubber hardness testing method for curved test piece

Introduction This Informative reference states the international rubber hardness testing method for curved test piece, and does not make a part of Standard.

1 Purpose This test shall be carried out to measure international rubber hardness degree of a test piece of vulcanized rubber whose target surface makes a curved surface. The measured values obtained by this method are always treated as an apparent hardness.

Remarks: The standards cited in this Informative reference are listed as follows.

ISO 48 : 1994 *Rubber, vulcanized or thermoplastic—Determination of hardness (hardness between 10 IRHD and 100 IRHD)*

ISO 7267/1 : 1986 *Rubber-covered rollers—Determination of apparent hardness—Part 1 : IRHD method*

ISO 7267/2 : 1986 *Rubber-covered rollers—Determination of apparent hardness—Part 2 : Shore-type durometer method*

2 Type of testing method

- (1) CH method (normal size curved surface test for high hardness)
- (2) CN method (normal size curved surface test for normal hardness)
- (3) CM method (microsize curved surface test for normal hardness)
- (4) CL method (normal size curved surface test for low hardness)

3 Scope CH method, CN method, CM method, and CL method are the modified H method, N method, M method, and L method for the purpose of making them applicable to the test piece whose target surface is curved, and there are the following two cases⁽¹⁾.

- (1) Test piece or sample is large enough to place the hardness testing apparatus on it.
- (2) Test piece or sample is so small that it must be placed on a holding base together with a hardness testing apparatus. The case where the sample is put on a flat sample base which makes one body with a testing apparatus, is included in this case.

Note (1) Generally, these tests are carried out directly on products, so that the thickness of rubber is not constant, and in many cases, the lateral distance from the end ball of a plunger to the edge of sample is smaller than the smallest distance shown in 4.4.3 in the body of this Standard, and the influence owing to the distance from the edge is not negligible.

Therefore, the measured values resulted from these methods don't coincide with the values obtained by the measurements of the plate-type test pieces with flat parallel surfaces and the same thickness as that of standard test pieces or products which are specified in H method, N method, M method and L method.

This means that, the results obtained by measuring curved surface are the peculiar measurements which are applicable only to the test pieces or the products having special shape and special dimensions and further being kept in special method. In extreme case, these measured values show discrepancy of 10 IRHD from the standard hardness. The measured values on the surface buffed to eliminate covered cloth or treated specially, shows a little difference value from the value on flat surface which has been finished with molding.

4 Testing apparatus

4.1 General matters Basically, testing apparatus follows 4.3 of the body of this Standard, but the following gives difference.

4.2 Testing apparatus for cylindrical surface of 50 mm or more radius As shown in Informative reference Fig. 1, the bottom base of the testing apparatus has a hole through which annular pressure foot can penetrate, for the measurement even when sample is put under the base.

There are two cylindrical surfaces which are parallel each other under the base, and these are parallel to the horizontal surface of the base. The diameter of these cylinders and the distance between them shall be suitable for setting up testing apparatus on the target curved surface of sample. Alternatively, the base, on which adjustable legs with universal joints are attached to comply with the target curved surface, may be used.

4.3 Testing apparatus for two-way curved surface of 50 mm or more radius The testing apparatus with adjustable legs with universal joints shown in 4.2 can be used.

4.4 Testing apparatus for cylindrical surface and two-way curved surface of 4 mm to 50 mm radius When target surface is too small to set a testing apparatus on it, as shown in Informative reference Fig. 2, fix test piece or sample using a special jig, V-block, or the like, and set the plunger to be perpendicular onto the target surface. When a small test piece is fixed on a sample table, wax may be used⁽²⁾⁽³⁾.

Notes ⁽²⁾ The testing apparatus for M method shall be generally used only for the test piece whose thickness is 4 mm or less.

⁽³⁾ The testing apparatus for M method, whose sample table is forced up owing to the action of a spring, is not suitable for the large-sized test piece or sample having curved surface with large radius.

4.5 Testing apparatus for small type O-ring and curved sample of 4 mm or less radius In these cases, hold a test piece on the table of testing apparatus using a suitable jig, block, wax, or the like. Carry out measurement using a testing apparatus of M method. The test piece having the minimum radius of 0.8 mm or less cannot be measured.

Informative reference Fig. 1
Example of setting a testing apparatus for sample with large diameter

Informative reference Fig. 2
Example of setting a testing apparatus for sample with small diameter

5 Test pieces

5.1 General matters The test pieces for CH method, CN method, CM method, and CL method are the products or the pieces prepared by cutting the products. The bottom side of the test piece which has been cut out shall be held with suitable method. In case of the target surface is covered with cloth, it must be buffed before testing. In order to recover it from the influence by buffing, allow it to stand for 16 h or more under standard condition of laboratory, and then carry out conditioning under standard condition according to (3) of 4.5.1 in the body of this Standard. This duration may be included in the duration for recovering.

5.2 Sampling and preparation of test pieces The sampling and preparation of test pieces shall follow 4.4.4 in the body of this Standard.

5.3 Selection of test pieces The selection of test pieces shall follow 4.4.5 in the body of this Standard.

6 Testing method The testing method shall follow 4.5 in the body of this Standard.

22.

K 6253 : 1997

7 Arrangement of test results Round off the median of 3 or 5 measurements to whole number according to JIS Z 8401, and then mark sign IRHD after the value. After that, mark sign "/", and then mark CH, CN, CM, or CL which means testing method.

Example : 50 IRHD/CM: means that a curved test piece is measured by CM method of international rubber hardness curved-surface test, and the hardness is 50 IRHD.

8 Record On test result, the following items shall be recorded.

- (1) Test result
- (2) Shape and dimensions of test pieces
- (3) Sampling and preparation methods of test piece
- (4) Test temperature
- (5) Other items specially needed

Errata for JIS (English edition) are printed in *Standardization Journal*, published monthly by the Japanese Standards Association, and also provided to subscribers of JIS (English edition) in *Monthly Information*.

Errata will be provided upon request, please contact:

- (3) The testing apparatus for M method is the one prepared by miniaturizing the testing apparatus for N method by about one-sixth to measure the test piece with thin thickness, therefore the depth of plunger indentation by M method is just one-sixth that by N method. The results given by M method are not always coincident with the results given by N method because of the surface effect of rubber or slight roughness of the surface.

4.3 Testing apparatus

4.3.1 Outline of testing apparatus The testing apparatus is composed of a holding base for test piece by which a test piece is kept, an annular pressure foot by which the surface of a test piece is pressed, a plunger, with a ball-type lower end, set at the center of hole of pressure foot, a device for loading which gives an indenting force on a plunger to make an indentation on a test piece, a measuring device to measure depth of an indentation impressed on a test piece, and a vibrating device to lessen friction. The dimensions of main parts and the specification of force are shown in Table 2.

A thermostat may be provided for measuring a test temperature other than standard condition of laboratory.

Table 2 Main dimensions and forces of testing apparatus

Type of tests	Diameter of ball of plunger end mm	Face of pressure foot			Force applying at ball of plunger end		
		Diameter mm	Diameter of hole mm	Force exerted on face of pressure foot	Contact force	Indenting force	Total
H method	1.00 ± 0.01	20 ± 1	6 ± 1	$8.3 \pm 1.5 \text{ N}$ ($846 \pm 153 \text{ gf}$)	$0.30 \pm 0.02 \text{ N}$ ($30.6 \pm 2.0 \text{ gf}$)	$5.40 \pm 0.01 \text{ N}$ ($550.6 \pm 1.0 \text{ gf}$)	$5.70 \pm 0.03 \text{ N}$ ($581.2 \pm 3.1 \text{ gf}$)
N method	2.50 ± 0.01	20 ± 1	6 ± 1				
L method	5.00 ± 0.01	22 ± 1	10 ± 1				
M method	0.395 ± 0.005	3.35 ± 0.15	1.00 ± 0.15	⁽⁴⁾ $235 \pm 30 \text{ mN}$ ($24.0 \pm 3.1 \text{ gf}$)	$8.3 \pm 0.5 \text{ mN}$ ($0.85 \pm 0.05 \text{ gf}$)	$145 \pm 0.5 \text{ mN}$ ($14.79 \pm 0.05 \text{ gf}$)	$153 \pm 1 \text{ mN}$ ($15.60 \pm 0.10 \text{ gf}$)

Note (4) When in M method a pressure adjusting spring installed at the bottom of a test-piece holding base makes pressure adjustment, the pressure adjusting spring must be controlled to be $(380 \pm 30) \text{ mN}$ ($(38.7 \pm 3.1) \text{ gf}$) because an indenting force 145 mN (14.8 gf) is added during measurement.

4.3.2 Face of pressure foot An annular pressure foot makes rectangular to a plunger. The diameter of face of pressure foot and the diameter of the hole for a plunger are as shown in Table 2. When the force exerted on the face of pressure foot is just as shown in Table 2, the pressure impressed on the surface of test piece becomes $(30 \pm 5) \text{ kPa}$ ($(0.306 \pm 0.051) \text{ kgf/cm}^2$)⁽⁵⁾. In order to measure the relative displacement between the face of pressure foot (upper surface of test piece) and the plunger, the face of pressure foot shall be firmly united with the measuring device of the depth of indentation.

Note (5) Some combination of all tolerances shown in Table 2 does not always give nice coincidence with the description of pressure $(30 \pm 5) \text{ kPa}$ ($(0.306 \pm 0.051) \text{ kgf/cm}^2$).
